2º

ANÁLISIS Y LECTURA CRÍTICA

**More than 70% of researchers
have tried and failed to
reproduce another scientist's
experiments, and more than
half have failed to reproduce
their own experiment**

A manifesto for reproducible science

Marcus R. Munafò^{1,2*}, Brian A. Nosek^{3,4}, Dorothy V. M. Bishop⁵, Katherine S. Button⁶,
Christopher D. Chambers⁷, Nathalie Percie du Sert⁸, Uri Simonsohn⁹, Eric-Jan Wagenmakers¹⁰,
Jennifer J. Ware¹¹ and John P. A. Ioannidis^{12,13,14}

Richard Feynman said:

“The first principle is that you must not fool yourself – and you are the easiest person to fool.”

Figure1 | Threats to reproducible science. An idealized version of the hypothetico-deductive model of the scientific method is shown. Various potential threats to this model exist (indicated in red), including lack of replication⁵, hypothesizing after the results are known (HARKing)⁷, poor study design, low statistical power², analytical flexibility⁵¹, P-hacking⁴, publication bias³ and lack of data sharing⁶. Together these will serve to undermine the robustness of published research, and may also impact on the ability of science to self-correct.

3ª

CORRELACIÓN NO IMPLICA CAUSALIDAD

CORRELACIONES ESPURIAS

CORRELACIONES ESPURIAS: En conjuntos de datos lo suficientemente amplios siempre es posible encontrar correlaciones casi perfectas entre variables disparatadas. Estas gráficas muestran dos ejemplos recopilados por Tyler Vigen, estudiante de criminología de Harvard. En ambos casos, el coeficiente de correlación es $r > 0,99$.

3^a

VALOR DE LA EXPERIENCIA Y EL CONTEXTO

Research alone is not sufficient to prevent sports injury

Dale Hanson,¹ John P Allegrante,^{2,3} David A Sleet,⁴ Caroline F Finch⁵

Figure 1 Integrating expertise to ensure comprehensive, evidence-based interventions that are practical and relevant when applied in the real world.

“...63% of publications were descriptive (Stages 1 and 2), 11% were concerned with method development and 16% were intervention-based (Stage 3), and only 5% were concerned with institutionalisation or policy implementation research, with less than 1% containing diffusion research (Stage 4)”.

A photograph of Francisco Sánchez Gómez, a flamenco guitarist, playing a yellow acoustic guitar. He is wearing a dark vest over a white shirt and dark trousers. The background is dark, and the lighting is focused on him and his instrument.

**“Llevo desde niño
practicando todos los días
una media de 14 horas
y a eso, en mi tierra,
le llaman duende.”**

**Francisco Sánchez Gómez
(Paco de Lucía)**

4^a

COMPRENSIÓN DE LA VARIABILIDAD

"Toda la ciencia, a lo largo del siglo XIX y gran parte del XX estaba obsesionada con principios universales. Psicólogos, investigadores médicos y economistas estaba interesados en descubrir las reglas que gobiernan la manera en que todos nosotros nos comportamos, pero eso cambió.

En los últimos 10 o 15 años ha habido la transformación desde la búsqueda de principios universales a la comprensión de la variabilidad"

5^a

Injuries affect team performance negatively
in professional football: an 11-year follow-up
of the UEFA Champions League injury study

Martin Häggglund,^{1,2} Markus Waldén,^{2,3} Henrik Magnusson,^{1,2} Karolina Kristenson,^{2,3}
Håkan Bengtsson,² Jan Ekstrand^{2,3}

Table 3 Association between team season injury rates and performance in professional football

	Crude analyses*			Adjusted analyses*		
	β	95% CI	p Value	β	95% CI	p Value
Final league ranking†						
Injury incidence	-0.057	-0.187 to 0.072	0.386	-0.049	-0.161 to 0.062	0.387
Injury burden	-0.009	-0.017 to -0.002	0.015	-0.010	-0.017 to -0.002	0.011
Match availability	0.086	0.005 to 0.168	0.037	0.085	0.008 to 0.163	0.031
Points per league match†						
Injury incidence	-0.026	-0.048 to -0.003	0.026	-0.024	-0.046 to -0.002	0.035
Injury burden	-0.002	-0.003 to -0.001	<0.001	-0.002	-0.003 to -0.001	<0.001
Match availability	0.019	0.009 to 0.029	<0.001	0.019	0.009 to 0.028	<0.001
UEFA SCC‡						
Injury incidence	0.228	-0.533 to 0.990	0.557	0.198	-0.634 to 1.030	0.641
Injury burden	-0.016	-0.032 to 0.001	0.062	-0.021	-0.042 to -0.001	0.043
Match availability	0.179	-0.009 to 0.367	0.062	0.205	0.002 to 0.408	0.048

*Analyses were made using a Generalised Estimating Equation with identity link to fit a linear regression on team-level data, with each team-season change as an observation. A negative β value for injury incidence and injury burden, and a positive β value for match availability, indicate an association between a lower season injury rate (compared with the adjacent preceding season) and a higher final league ranking, higher average points per league match and higher UEFA SCC, respectively.

†Adjusted analyses of final league ranking and points per league match included change of head coach and UEFA SCC as independent variables.

‡Adjusted analyses of UEFA SCC included change of head coach and points per league match as independent variables.

SCC, season club coefficient; UEFA, Union of European Football associations.

**MENOS LESIONES POR

MECANISMO DE LESIÓN

ACELERACIÓN

Early Swing Phase

Hip-flexor muscles generate force at the same time as the knee-extensor muscles absorbed energy through an eccentric muscle action

Electromyographic Analysis of Hip and Knee Musculature During Running

William H. Montgomery III, MD, Marilyn Pink,* MS, PT, and Jacquelin Perry, MD

From the Centinela Hospital Medical Center, Biomechanics Laboratory, Inglewood, California

The association football medical research programme: an audit of injuries in professional football

R D Hawkins, M A Hulse, C Wilkinson, A Hodson, M Gibson

MECANISMO DE LESIÓN DESACELERACIÓN

Football players repeatedly change in direction, decelerate or stop suddenly.

This results in additional horizontal braking forces and consequently more eccentric force imposed on the quadriceps.

(Mendiguchía, et al. 2013)

FUERZA / FLEXORES DE CADERA

*Data are reported as the mean ± SD percent of maximal voluntary isometric contraction.

[†]Main effect demonstrated greater activity during the instep kick ($P < .01$).

[‡]No significant difference in muscle activation between kicks for any phase ($P > .05$).

[§]Interaction effect ($P = .02$); greater activity for side-foot kick during phase 5 ($P = .03$).

^{||}Main effect demonstrated greater activity during the instep kick ($P = .016$).

[#]Main effect demonstrated greater activity during the instep kick ($P < .01$).

^{*}Main effect demonstrated greater activity during the instep kick ($P < .01$).

^{**}Interaction effect ($P < .01$); greater activity for side-foot kick during phases 2-4 ($P < .01$).

MECANISMO DE LESIÓN

GOLPEO

The most common mechanism of rectus femoris muscle injury in soccer is kicking.
(Woods, et al. 2002)

Figure 2. Definition of the three phases during kicking based on typical segment motions.

MECANISMO DE LESIÓN GOLPEO

Three-dimensional kinetic analysis of side-foot and instep soccer kicks

HIROYUKI NUNOME, TAKESHI ASAI, YASUO IKEGAMI, and SHINJI SAKURAI

ENTRENAR LOS MUSCULOS RESPETANDO SU ANATOMIA y FUNCIÓN TRIDIMENSIONAL

Short communication

Region specificity of rectus femoris muscle for force vectors in vivo

Shota Hagio, Kaori Nagata, Motoki Kouzaki*

Laboratory of Neurophysiology, Graduate School of Human and Environmental Studies, Kyoto University, Yoshida-nihonmatsu-cho, Sakyo-ku, Kyoto 606-8501, Japan

Esta acción va acompañada de **Vectores Rotacionales**.

FIGURE 3—Changes in joint torque and angular velocity at the hip of the side-foot (right column) and instep (left column) kicks. For the hip adduction/abduction (top), positive and negative values corresponded to adduction and abduction, respectively. For the hip flexion/extension (middle), positive and negative values corresponded to flexion and extension, respectively. For the hip external/internal rotation (bottom), positive and negative values corresponded to external and internal rotation, respectively.

“...These findings support our hypothesis that divergent regions of muscle fibers within RF have different functions for determining the force direction”

MECANISMO DE LESIÓN

GOLPEO

Foot to ball contact is much lower than ground reaction forces in the deceleration at the final step of the kicking leg.

"Deceleration during a kicking motion causes the body to lean backwards and the leg to move farther behind the body than normal, which places extra stress and strain on the rectus femoris". ([Mendiguchía, et al. 2013](#))
